Research Objectives

- Through this study, we are aiming to get a deeper understanding as to how the poke feature is being used within the Facebook app and if it is worth the investment.
- We will analyze the data collected to determine whether we should remove the Facebook “poke” feature or keep it in the app.

Study Design

Research Method

- Semi-structured Interview Study
- Participants will consist of people between the ages of 25-50 who are active users of Facebook

Setting

- Public location (cafe, lounge space, etc.)

Recruitment

- Have the graphic design team create an advertisement geared towards our target audience.

Why An Interview Study

We decided to opt for an interview study because of how great it is at generating good insights. We chose this over something like a ethnographic study because it isn't practical to sit there and watch participants use facebook until they use the poke feature. It is much more efficient to just ask them.

Agile Development

If asked to conduct this study within the span of 3 days we would keep it as an interview study, however some things we would change are:

- **Study Design:** instead of a semi-structured interview, we would change it to rely strictly on surveys. We would make the surveys short and include some open-ended questions to still get a deep understanding while making data collection quicker and more efficient. Surveys would also make it easier to analyze the data because we can look at the numbers and look at any patterns there may be throughout participants
